

Py City Schools Observable Trends

1. The top five schools by passing rate were all Charter schools, while the bottom five were all District Schools.
2. All of the schools had average reading scores and math scores within under a 10 percent range (and all above passing). So it is interesting to me that the overall passing rates were so heavily skewed.
3. It seems that school size has a positive correlation with average scores and passing rates, which is rather counter-intuitive, as popular belief would probably hold that a smaller school can provide better support for students and lead to better test scores. Spending ranges per student also had a positive correlation with scores and passing rates. However, this trend was much more predictable.
